# Web Browsing with HTTP

3

# Web Browsing with HTTP

4

# Web Access with Hypertext Transfer Protocol

- ▶ HTTP is a request/response protocol for web browsing
- ▶ HTTP is stateless; no dependence between a request and previous request
- ▶ User Agent (client) sends HTTP Request message
- ▶ Server responds with HTTP Response message
- ▶ Default server port number: 80
- ▶ Generic HTTP message format:

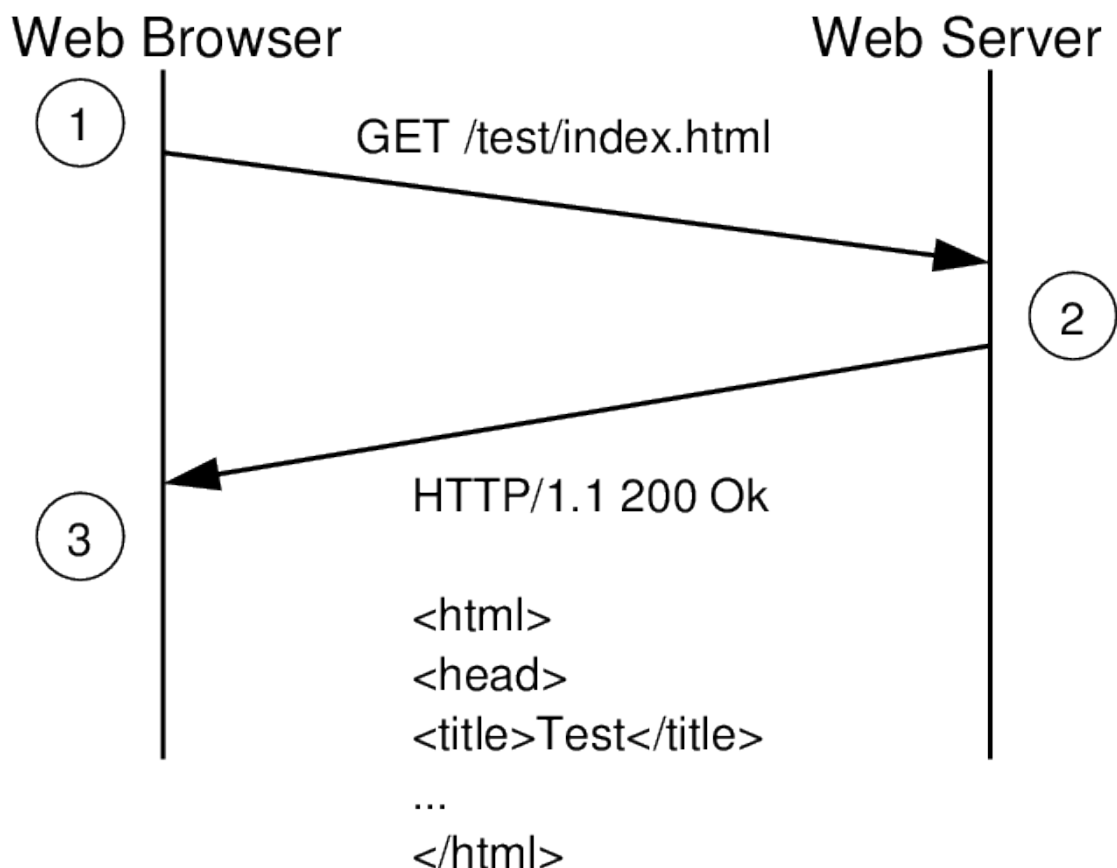

```

Start line
Optional header lines
<empty line>
Optional message body
  
```

- ▶ Start line differs for request and response
- ▶ Header format: field-name: value

5

## HTTP Example

6

# HTTP Request Messages

- ▶ Start line: Method URL Version
- ▶ Methods:
  - ▶ GET: retrieve the resource at the specific URL
  - ▶ HEAD: same as GET, except do not return message body (only header)
  - ▶ OPTIONS: retrieve options available for resource or server
  - ▶ POST: asks server to accept and process the attached data at the resource
  - ▶ ...
- ▶ Version: version of HTTP, e.g. HTTP/1.0, HTTP/1.1

7

# HTTP Response Messages

- ▶ Start line: Version StatusCode StatusReason
- ▶ Status Codes and Reasons:
  - ▶ 100: Continue (the client should continue with its request)
  - ▶ 200: OK (the request succeeded)
  - ▶ 301: Moved Permanently (the requested resource has a new URL)
  - ▶ 304: Not Modified (resource hasn't changed since last request, client should use cached copy)
  - ▶ 401: Unauthorized (request must include user authentication)
  - ▶ 403: Forbidden (request was understood, but server refuses to process it)
  - ▶ 404: Not Found (server cannot find resource at requested URL)
  - ▶ 503: Service Unavailable (server currently unable to handle request, e.g. server is too busy)

8

# HTTP Headers

- ▶ Date: data and time of message generation
- ▶ Host: domain name of host of resource (means relative URLs can be used)
- ▶ Accept-Charset, Accept-Encoding, Accept-Language: indicate the character sets, encodings and languages that client can accept
- ▶ Authorization: include user credentials (e.g. username, password) if authorization is required
- ▶ User-Agent: indicates information about the client (user agent), e.g. web browser
- ▶ Referrer: URL from which this request came from
- ▶ Content-Encoding: encoding or compression, e.g. gzip
- ▶ Content-Length: length of message body on bytes
- ▶ Content-Type: the type of content in message body
- ▶ Last-Modified: indicates data/time when content was last modified on server

9

# Contents

## Web Browsing

## Web Applications

## Confidential Web Communications with HTTPS

## Digital Certificates

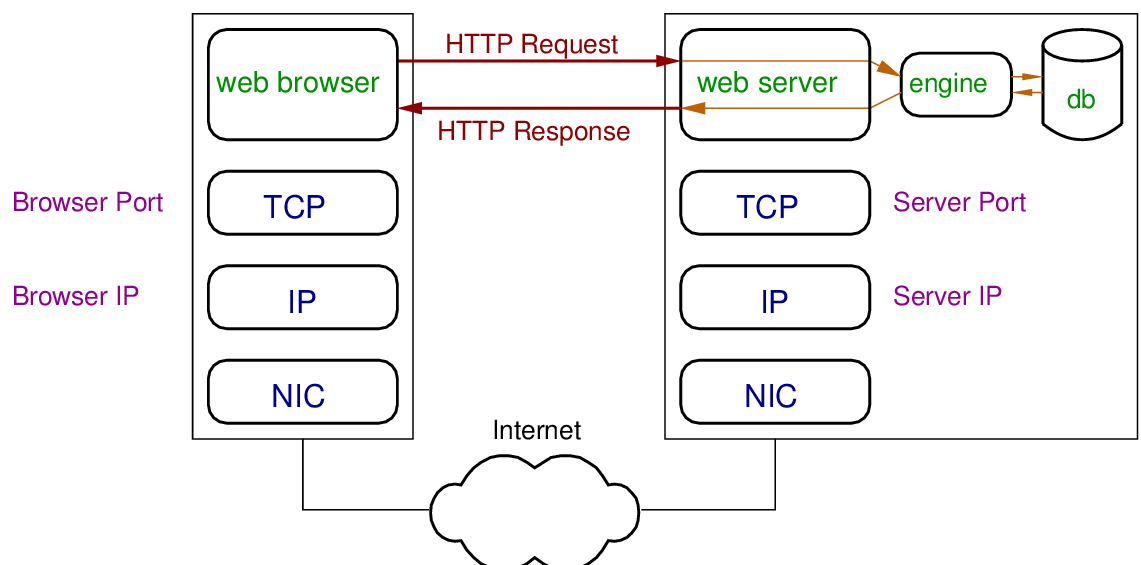

## Summary

# Web Applications

- ▶ Plain, static web pages: HTML, images and other files served to browser
- ▶ But many applications use dynamic content
  - ▶ Content server to browse changes depending on request
  - ▶ Provides interactive, tailored content
  - ▶ Client-side: JavaScript, Flash, Silverlight, Java
  - ▶ Server-side: CGI, ASP, PHP, Coldfusion, Java, ...
  - ▶ Content stored in databases

11

## Dynamic Content with Server-Side Processing

12

# What are the security issues?

- ▶ Data transmitted between browser and server is confidential: encryption with HTTPS
- ▶ Browser sure it is communicating with intended server: digital certificates
- ▶ Server sure it is communicating with intended user: password authentication, session management
- ▶ Actions performed by server (engine) are appropriate: authentication, access control
- ▶ Actions of user (of browser) are kept private: anonymity services

Confidential Web Communications with HTTPS

Digital Certificates

Summary

14

# HTTPS

- ▶ HTTPS: HTTP over SSL (or TLS)
- ▶ URL uses https://
- ▶ Web server listens on port 443
- ▶ Encrypt: URL of requested document, contents of document, contents of browser forms, cookies, contents of HTTP header
- ▶ Server is authenticated using certificate (using SSL)
- ▶ Client is authenticated using password (using HTTP)

15

# SSL and TLS

- ▶ Secure Sockets Layer (SSL) originated in Netscape web browser
- ▶ Transport Layer Security (TLS) standardised by IETF
- ▶ SSLv3 and TLS are almost the same
- ▶ SSL provides security services to application layer protocols using TCP
- ▶ SSL architecture consists of multiple protocols

16

# SSL Architecture

**Record:** provides confidentiality and message integrity

**Handshake:** authenticate entities, negotiate parameter values

**Change Cipher:** change cipher for use in connection

**Alert:** alert peer entity of status/warning/error

17

## Connections and Sessions

- ▶ SSL connection corresponds with TCP connection
  - ▶ Client and server may have multiple connections
- ▶ SSL session is association between client and server
  - ▶ Session created with Handshake protocol
  - ▶ Multiple connections can be associated with one session
  - ▶ Security parameters for session can be shared for connections
- ▶ State information is stored after Handshake protocol
  - ▶ Session: ID, certificate, compression, cipher spec, master secret, ...
  - ▶ Connection: random values, encrypt keys, MAC secrets, IV, sequence numbers, ...

18

# SSL Record Protocol Operation

19

## SSL Handshake Protocol

- ▶ Allow client and server to authenticate each other
- ▶ Negotiate encryption and MAC algorithms, exchange keys
  - ▶ Key Exchange: RSA, Diffie-Hellman
  - ▶ MAC: HMAC using SHA or MD5
  - ▶ Encryption: RC4, RC2, DES, 3DES, IDEA, AES
- ▶ Multiple phases:
  1. Establish security capabilities: client proposes algorithms, server selects one
  2. Server authentication and key exchange
  3. Client authentication and key exchange
  4. Finish setting up connection

## Digital Certificates

## Summary

21

# Authentication and Encryption in Web Browsing

- ▶ Browser and server do not have pre-shared secrets
- ▶ Use public key cryptography to securely exchange secret key
  - ▶ RSA/DSA
  - ▶ Diffie-Hellman key exchange
  - ▶ Elliptic curve cryptography
- ▶ Once a secret key is exchanged, use symmetric key encryption
  - ▶ AES, RC4, 3DES, ...
- ▶ E.g. with RSA: if a server sends browser its RSA public key, how does browser know it is indeed RSA public key of server?
  - ▶ Get a trusted third party to confirm it is the servers RSA public key

22

# Digital Certificates

## Step 1: Server Obtains Digital Certificate

- ▶ Server (owner) creates key pair:  $(PU_s, PR_s)$
- ▶ Server confirms identity,  $ID_s$ , with trusted third party called Certificate Authority
- ▶ CA issues server with a digital certificate by signing relevant info:

$$C_s = (ID_s || PU_s || T, E(PR_{CA}, H(ID_s || PU_s || T)))$$

- ▶ A timestamp,  $T$ , can be used to determine how long the certificate is valid
- ▶ X.509 specifies standard format of certificates

23

# Digital Certificates

## Step 2: Server Sends Digital Certificate to Browser

- ▶ When browser initiates communications with server, server responds with  $C_s$
- ▶ Browser verifies signature using  $PU_{CA}$ 
  - ▶ Assumes browser already knows and trusts  $PU_{CA}$
  - ▶  $PU_{CA}$  is stored in self-signed certificate:

$$C_{CA} = (ID_{CA} || PU_{CA} || T, E(PR_{CA}, H(ID_{CA} || PU_{CA} || T)))$$

- ▶ Once verified, browser can choose secret value and send it encrypted using  $PU_s$  to server

24

# X.509 Certificates

- ▶ X.509 certificate format includes:
  - ▶ Version of X.509 certificate
  - ▶ Serial number unique to the issuer (CA)
  - ▶ Signature algorithm
  - ▶ Issuer's name and unique identifier
  - ▶ Period of validity (start time, end time)
  - ▶ Subject's name and unique identifier
  - ▶ Subject's public key information: algorithm, parameters, key
  - ▶ Signature
- ▶ Certificates may be revoked before expiry
  - ▶ CA signs a Certificate Revocation List (CRL), which is publicly available

25

## Digital Certificates in Practice

### How does a server obtain a certificate?

- ▶ Prove identity to CA by:
  - ▶ Domain validation
  - ▶ Extended validation
- ▶ Free and commercial services

### How does browser obtain CA certificate?

- ▶ Pre-loaded into browsers
- ▶ Hierarchy of certificates is supported

### What if CA certificate is not in browser?

- ▶ Browsers commonly present warning to user

26

# Security Issues with Digital Certificates

- ▶ Identity verification of server (owners)
- ▶ Security of CA private key
- ▶ Pre-loaded certificates by browser publisher
- ▶ Response when invalid certificate received
- ▶ Algorithms used in certificates should be strong

27

### Web Browsing

### Web Applications

### Confidential Web Communications with HTTPS

### Digital Certificates

### Summary

28

## Key Points

- ▶ Web browsing uses HTTP over TCP
- ▶ Secure web browsing inserts SSL in between HTTP and TCP; HTTPS
- ▶ Secret key exchange between browser and server using public key crypto
- ▶ For browser to trust server public key, must be signed by trusted third party (certificate authority)
- ▶ X.509 digital certificates used in web browsing, email and many networked applications

29

## Security Issues

- ▶ Digital certificates rely on trustworthiness of certificate authorities
- ▶ Also rely on action by users: response with invalid certificate received; trusting browser CA list
- ▶ Man-in-the-middle interception/modification attacks on web browsing are easy *if* certificates are compromised

30

# Areas To Explore

- ▶ Public key distribution methods
- ▶ PGP and GPG for email
- ▶ Securing web applications, OWASP
